### Abstract

The article presents the results of research on epiphytic bryophyte communities of the Dendrological Park “Alexandria”. The study was conducted in the historical part of the arboretum in 2021. Among the investigated phorophytes were the following tree species: *Acer platanoides*, *A. pseudoplatanus*, *Betula pendula*, *Carpinus betulus*, *Fraxinus excelsior*, *Quercus robur*, *Populus* sp., *Salix babylonica*, and some others.

The research results showed that the epiphytic bryophyte vegetation of the historical part of the Dendrological Park “Alexandria” is represented by two unranked communities and 11 associations belonging to six unions, four orders, and three classes. The most widespread in the arboretum are the associations *Dicranoscoparii-Hypnetum filiformis*, *Platygyrietum repentis*, *Leskeetum polycarparae*, and the rankless community *Leucodon sciuroides* of the class *Frullanio dilatatae-Leucodontetea sciuroidis*.

It is shown that in terms of the number of detected bryophyte associations, the Dendrological Park “Alexandria” is similar to the National Nature Park “Homilsha Woods”, which is located in the Kharkiv region (hosts 11 reported associations) and the Nature Reserve “Kanivskyi” in the Cherkasy region (12 reported associations). However, it is poorer than the National Nature Park “Holosiivskyi” in Kyiv, where 16 bryoassociations were registered.

**Keywords:** epiphytic bryophyte communities, phorophyte, bryoassociations, Dendrological Park “Alexandria”

### Introduction

Bryophytes are an integral component in most ecosystems, forming fairly stable communities. Bryophyte communities are the basis of the moss cover and its structural elementary unit, which exists in nature and

can be classified. Currently, two approaches to classifying moss communities are known (Gapon, 2004). In the first approach, the bryogroups are considered synuses (a component of the horizontal structure of phytocenoses), which are an element of the general classification of vegetation.

**Figure 1.** The historical part of the Dendrological Park “Olexandria”. Numbers indicate the arboretum sections.

Investigation of moss synuses in Ukraine was carried by such bryologists as [Ulychna \(1958, 1980\)](#), [Partyka \(1966\)](#), and [Boyko \(1978\)](#).

According to the second approach, moss communities are considered independent coenoses classified independently from the associations of higher vascular plants. Still, they are classified according to the ecological and vegetation principles using the Brown-Blanquet method. The study and classification of bryophyte vegetation by the Brown-Blanquet method began in Ukraine only at the end of the 20th century ([Gapon et al., 1998](#)). Information about the bryophyte vegetation of the forest-steppe part of Ukraine is presented in a number of publications by Poltava bryologists Svitlana and Yurii Gapon ([Gapon 2007a, 2007b, 2009, 2012a, 2012b, 2015, 2017; Gapon & Gapon, 2018](#)).

An article on epiphytic and epixylic bryogroups of the National Nature Park “Holosiivskyi” appeared recently ([Onyshchenko & Virchenko, 2020](#)). The

bryocommunities of the Dendrological Park “Oleksandria” remained unstudied until yet. At the same time, this task was relevant because the diversity of tree species combined with humid habitats make the arboretum a perfect model object for studying epiphytic moss communities.

## Material and methods

In 2021, we conducted research to study the epiphytic bryophyte communities in the localities of the historical part of the Dendrological Park “Olexandria” (Fig. 1).

The moss communities were examined on the following phorophytes: *Acer platanoides* L., *A. pseudoplatanus* L., *Betula pendula* Roth, *Carpinus betulus* L., *Fraxinus excelsior* L., *Quercus robur* L., *Populus* sp., *Salix babylonica* L. and some other. Description of moss communities on experimental phorophytes was carried

**Table 1.** Synoptic table of epiphytic bryocommunities of the Dendrological Park "Olexandria" at the level of orders (constancy of species in %).

out using 10×40 cm plots, while the coordinates of the point, exposure, angle of inclination of the tree trunk, and height from the soil surface were recorded. In total, 47 such descriptions were made. The bryophyte associations names are provided according to [Marstaller \(2006\)](#), and higher syntaxonomy follows [Mucina et al. \(2016\)](#). The bryophyte taxonomy follows the recent checklist of [Hodgetts et al. \(2020\)](#).

## Results and discussion

The research results revealed that the epiphytic bryophyte vegetation of the historical part of the Dendrological Park "Olexandria" is represented by two unranked groups and 11 associations belonging to six unions, four orders, and three classes. The constancy of observed species in orders is shown in [Table 1](#).

## Prodromus of epiphytic bryophyte vegetation of the Dendrological Park "Olexandria"

### Class *Frullanio dilatatae-Leucodontetea sciuroidis* Mohan 1978

Order *Orthotrichetalia* Hadač in Klika & Hadač 1944

[unranked community] *Leucodon sciurooides*

Union *Leskeion polycarpare* Barkman 1958

*Leskeetum polycarpare* Horvat 1932

Union *Ulotion crispae* Ochsner 1928

*Pylaisietum polyanthae* Gams ex Felföldy 1941

Union *Syntrichion laevipilae* Ochsner 1928

*Orthotrichetum fallacis* von Krusenstjerna 1945

*Orthotrichetum speciosi* (Jäggli 1934)

Barkman 1958

*Syntrichio laevipilae-Orthotrichetum obtusifolii* Allorge 1922 em. Barkman 1958

Order *Dicranetalia scoparii* Barkman 1958

Union *Dicrano scoparii-Hypnion filiformis* Barkman 1958

*Platygyrietum repentis* LeBlank ex Marstaller 1986

*Ptilidio pulcherrimi-Hypnetum pallescentis* Herzog 1943

*Dicrano scoparii-Hypnetum filiformis* Barkman 1949

### Class *Cladonio digitatae-Lepidozietae*

#### *reptantis* Ježek & Vondráček 1962

Order *Brachythecietalia rutabulo-salebrosi* Marstaller 1987

*Union Bryo capillaris-Brachythecion rutabuli* Lecointe 1975

### Class *Neckeretea complanatae* Marstaller 1986

Order *Neckeretalia complanatae* Ježek & Vondráček 1962

*Union Neckerion complanatae* Šmarda & Hadač ex Klika 1946

*Anomodontetum attenuati* (Barkman 1958) Peciar 1965

*Anomodontetum longifolii* Waldheim 1944 [unranked community] *Anomodon viticulosus*

*Plagiomnion cuspidati-Homalietum trichomanoidis* (Peciar 1965) Marstaller

The class *Frullanio dilatatae-Leucodontetea sciuroidis* unites mostly epiphytic moss communities developing on the bark of living trees. Groups of the order *Orthotrichetalia* (described in Table 2) consist of heliophytic mesophytic and mesoxerophytic species

growing on trees with a neutral or alkaline bark reaction. Characteristic and dominant species of five associations of this order are *Leskea polycarpa* Hedw., *Pylaisia polyantha* (Hedw.) Schimp., and species of the genus *Orthotrichum* Hedw s.l. These communities occur on such tree species as *Salix babylonica*, *Populus* sp., *Fraxinus excelsior*, and *Acer platanoides*. The unranked community *Leucodon sciurooides* (Hedw.) Schwagr. also develops on maples and ash trees, less often on oaks.

Communities of the order *Dicranetalia scoparii* (described in Table 3) are confined to trees with an acidic bark reaction or dead. Investigation showed that mosses *Jochenia pallescens* (Hedw.) P. Beauv., *Hypnum cupressiforme* Hedw., *Platygyrium repens* (Brid.) Schimp., and *Dicranum montanum* Hedw. are characteristic and dominant species for three associations of this order. These communities occur on such tree species as *Betula pendula* and *Quercus robur*.

The class *Cladonio digitatae-Lepidozietae reptantis* (described in Table 4) comprises only one order *Brachythecietalia rutabulo-salebrosi*, with one union *Bryo capillaris-Brachythecion rutabuli*. *Brachythecium salebrosum* (Hoffm. ex F. Weber et D. Mohr) Schimp. is the characteristic and dominant species of the mentioned class and order. It was registered on *Betula pendula* and *Quercus robur*. The class generally includes epixylic groups, which are out of the scope of our current investigation. From this class, the association *Brachythecio salebrosi-Amblystegietum juratzkani* (Marstaller, 1987) with the characteristic species *Amblystegium serpens* (Hedw.) Schimp. can be identified in the arboretum. It was also discovered in the National Nature Park "Holosiivskyi" (Onyshchenko & Virchenko, 2020).

The class *Neckeretea complanatae* (described in Table 4) includes relatively large sciaphilic mosses growing on the substrates with a neutral or alkaline reaction. Such mosses as *Pseudanomodon attenuatus* (Hedw.) Huebener, *Anomodon longifolius* (Schleich. ex Brid.) Hartm., and *Homalia trichomanoides* (Hedw.) Brid. are characteristic and dominant species of three associations of the order *Neckeretalia complanatae*. These communities were discovered in the arboretum on the bark of *Fraxinus excelsior* and *Quercus petraea*

**Table 2.** Descriptions of the order *Orthotrichetalia* and unidentified descriptions of the class *Frullanio dilatatae-Leucodontetea sciuroidis*.

trees. The unranked community *Anomodon viticulosus* (Hedw.) Hook et Taylor was registered on the same phorophytes. In the Dendrological Park "Alexandria", communities of this class occur less often compared to those of previously mentioned classes; they are more spread into the old trees and more humid ecotopes on the slopes of the ravines. In some places of the arboretum, especially on a plateau, the drying up of *Anomodon* Hook et Taylor s.l. species has been noted, which leads to the degradation of these communities.

In terms of the number of detected moss associations, the Dendrological Park "Alexandria" is similar to the National Nature Park "Homilsha Woods" in the Kharkiv region, where 11 moss associations were found (Gapon, 2012a) and the Kanivskyi Nature Reserve in the Cherkasy region, were observed 12 associations (Gapon, 2012b), but poorer than the "Holosiivskyi" National Nature Park in Kyiv, where 16 bryoassociations were registered (Onyshchenko & Virchenko, 2020).

We believe that communities of the class *Cladonio digitatae-Lepidozietea reptantis*, which mainly develop on dead wood and epilithic mossy vegetation, deserve further research in the Dendrological Park "Alexandria". The syntaxonomic affiliation of the expansive epiphytic mosses *Dicranum tauricum* Sap. and *Syntrichia papillosa* (Wills.) Jur., which have been spreading on tree trunks in the natural forests of Ukraine in recent decades (Virchenko, 2011) and were discovered on the territory of Dendrological Park "Alexandria" also require a separate study (Virchenko & Peskach, 2020).

## Conclusions

Results of the investigations showed that the epiphytic bryophyte vegetation of the historical part of the Dendrological Park "Alexandria" is represented by two unranked communities and 11 associations that belong to six unions, four orders, and three classes.

The most widespread in the arboretum are the associations *Dicrano scoparii-Hypnetum filiformis*, *Platygyrietum repantis*, *Leskeetum polycarphae*, and the unranked community *Leucodon sciurooides* of the class *Frullanio dilatatae-Leucodontetea sciurooidis*. Communities of the class *Neckeretea complanatae* (*Anomodontetum attenuati*, *Anomodontetum longifolii*, *Plagiomnio cuspidati-Homalietum trichomanoidis*, and unranked community *Anomodon viticulosus*) occur less frequently in the Dendrological Park "Alexandria" and tend to more humid ecotopes.

## Епіфітні мохові угруповання дендропарку “Олександрія” НАН України

Любов Плескач<sup>1</sup>, Віталій Вірченко<sup>2,\*</sup>, Віктор Онищенко<sup>2</sup>

<sup>1</sup> Державний дендрологічний парк «Олександрія» НАН України, Біла Церква, Київська обл., 09113, Україна; l.pleskach@ukr.net

<sup>2</sup> Інститут ботаніки ім. М.Г. Холодного НАН України, вул. Терещенківська, 2, Київ, 01004, Україна;  
\* vir\_chen\_ko@ukr.net

В статті представлені результати досліджень епіфітних мохових угруповань дендропарку “Олександрія”. Дослідження проводили в локалітетах історичної частини дендропарку “Олександрія” в 2021 році. Серед досліджених форофітів були представлені наступні деревні види: *Acer platanoides*, *A. pseudoplatanus*, *Betula pendula*, *Carpinus betulus*, *Fraxinus excelsior*, *Quercus robur*, *Populus* sp., *Salix babylonica* та деякі інші.

Результати досліджень показали, що епіфітна мохова рослинність історичної частини дендропарку “Олександрія” представлена двома безранговими угрупованнями та 11 асоціаціями, які належать до шести союзів, чотирьох порядків і трьох класів. Найбільш поширеними у дендропарку виявилися асоціації *Dicrano scoparii-Hypnetum filiformis*, *Platygyrietum repentis*, *Leskeetum polycarpeae* та безрангове угруповання *Leucodon sciuroides* класу *Frullanio dilatatae-Leucodontetea sciuroidis*.

Встановлено, що за кількістю виявлених мохових асоціацій дендропарк “Олександрія” подібний до Національного природного парку “Гомільшанські ліси” Харківської обл. (11 зареєстрованих асоціацій) та Природного заповідника “Канівський” Черкаської обл. (12 зареєстрованих асоціацій), але бідніший від Національного природного парку “Голосіївський”, що знаходиться у місті Київ, де зареєстровано 16 бріоасоціацій.

**Ключові слова:** епіфітні мохові угруповання, форофіт, бріоасоціації, дендропарк “Олександрія”
